LISTS

Gustavo Carvalho (ghpc@cin.ufpe.br)

Universidade Federal de Pernambuco Centro de Informática, 50740-560, Brazil

Agenda

- Abstract data types and data structures
- List ADT
- List ADT as an array
- List ADT as a linked list
- Asymptotic efficiency of lists

Abstract data types and data structures

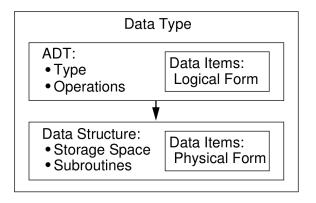

Important concepts

- Type: a collection of values
- Simple vs. composite type
- Data type: a type and operations to manipulate the type
- Abstract data type (ADT): a data type as a software component
- Data structure: implementation for an ADT
- Multiple implementations for the same ADT

Abstract data types and data structures¹

Source: C. Shaffer. Data Structures and Algorithm Analysis. 2013.

Agenda

- 1 Abstract data types and data structures
- 2 List ADT
- 3 List ADT as an array
- 4 List ADT as a linked list
- 5 Asymptotic efficiency of lists
- 6 Bibliography

List ADT

Mathematical abstraction

- Sequences of homogenous elements
- A symbol | to denote the current position of the cursor

Example

- Let $I = \langle 20, 23 \mid 12, 15 \rangle$
- After inserting 10 in I, we have $I' = (20, 23 \mid 10, 12, 15)$
- After removing an element from I, we have $I'' = \langle 20, 23 \mid 12, 15 \rangle$

6/56

List ADT

Operations (let *E* be an arbitrary data type):

- void clear(List I);
- void insert(List I, E item);
- void append(List I, E item);
- E remove(List I);
- void moveToStart(List I);
- void moveToEnd(List I);
- void prev(List I);
- void next(List I);
- int length(List I);
- int currPos(List I);
- void moveToPos(List I, int pos);
- E getValue(List I);

Declaring an ADT in C

Type and operations as prototypes in a .h file

- A function prototype to create an instance of the ADT
- \blacksquare Provide to the functions the values to be manipulated (List* 1)

```
#ifndef _LIST_H
#define _LIST_H
typedef struct list List;
List* create_list(int size); // Creates a new list
void clear(List* 1);
void insert(List* 1, E item);
#endif
```

8/56

Declaring an ADT in Java

Typically, an interface, in addition to operations as abstract methods

- No need of a function prototype to create an instance of the ADT
- No need to provide to the methods the values to be manipulated

```
public interface List {
    public void clear();
    public void insert(E item);
    // ...
```

Operations implemented in the logical level

We might have operations implemented in the logical level

Same implementation regardless of data structure

Algorithm: boolean find(List I, int k)

```
moveToStart(I);
while currPos(I) < length(I) do
if k = getValue(I) then
return true;
next(I);</pre>
```

return false:

Operations implemented in the logical level

Concrete functions defined in the *.h file

```
#ifndef LIST H
   #define _LIST_H
   // ...
   bool find(List* l, int k) {
       moveToStart(1):
       while(currPos(l) < length(l)) {</pre>
            if (k == getValue(l)) { return true; }
            next(1);
10
        return false;
11
12
   #endif
13
```

Operations implemented in the logical level

Concrete methods defined in an abstract class

```
public abstract class List {
        // ...
        public boolean find(int k) {
            this.moveToStart();
            while (this.currPos() < this.length()) {</pre>
                if (k == this.getValue()) { return true; }
                this.next();
            return false;
10
12
```

Agenda

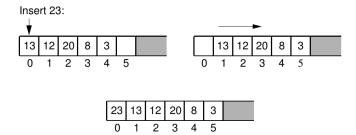

- Abstract data types and data structures
- List ADT
- 3 List ADT as an array
- List ADT as a linked list
- Asymptotic efficiency of lists

List ADT implemented as an array²

Insertion

Deletion

Analogous implementation

²Source: C. Shaffer. Data Structures and Algorithm Analysis. 2013.

List ADT implemented as an array

Composite type:

```
int maxSize:
                                               // capacity
int listSize;
                                   // number of elements
int curr:
                              // position of the cursor
E[] listArray;
                                    // array with values
```

Algorithm: List create_list(int size)

- I.maxSize ← size:
- *I.listSize* ← *I.curr* ← 0:
- $I.listArray \leftarrow new E[size];$
- return /:

List ADT implemented as an array (C)

Data structure: defined in a .c file

```
#include "list.h"
   typedef struct list {
       int maxSize; int listSize; int curr; E* listArray;
   } List;
   List* create list(int size) {
       List* 1 = (List*) malloc(sizeof(List));
       1->maxSize = size;
    1->listSize = 1->curr = 0;
       1->listArray = (E*) malloc(size * sizeof(E));
10
      return 1;
11
12
```

List ADT implemented as an array (Java)

Data structure: defined in a concrete class.

```
public class ArrayList implements List { // List: an interface
       private int maxSize; private int listSize;
       private int curr; private E[] listArray;
       // The constructor has the role of ``create list''
       public ArrayList(int size) {
           this.maxSize = size;
           this.listSize = this.curr = 0;
           this.listArray = new E[size];
10
11
       //...
12
13
```

Algorithm: void insert(List I, E it)

```
if I.listSize > I.maxSize then error;
   i \leftarrow I.listSize:
   while i > l.curr do
        I.listArray[i] \leftarrow I.listArray[i-1];
4
                                                               // shift right
        i--:
5
```

- $I.listArray[I.curr] \leftarrow it;$
- I.listSize++:

List ADT implemented as a linked list³

Empty list: header node vs. space cases (insert and remove)

Attention to where curr is pointing to (not as follows)

 $^{^3\}mbox{Source}$ C. Shaffer. Data Structures and Algorithm Analysis. 2013.

List ADT implemented as a linked list: insertion⁴

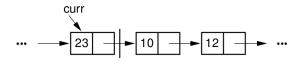

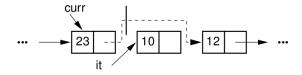

⁴Source: C. Shaffer. Data Structures and Algorithm Analysis. 2013.

List ADT implemented as a linked list: deletion⁵

Important: memory deallocation

- With no garbage collection: user's duty
- With garbage collection: GC's duty

⁵ Source: C. Shaffer. Data Structures and Algorithm Analysis. 2013.

List ADT implemented as a linked list

Composite type (Link):

Algorithm: Link create_link(E it, Link nextval)

n.element \leftarrow *it*; *n.next* \leftarrow *nextval*; **return** *n*;

Algorithm: Link create_link(Link nextval)

1 $n.next \leftarrow nextval$; return n;

List ADT implemented as a linked list

Composite type (List):

- Link head;
- Link tail;
- Link curr;
- int *cnt*;

// list size

Algorithm: List create_list()

```
I.curr \leftarrow I.tail \leftarrow I.head \leftarrow create\_link(NULL);
                                                                // header node
```

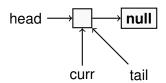

- $I.cnt \leftarrow 0$: 2
- return /;

Algorithm: void insert(List I, E it)

- 1 I.curr.next ← create_link(it, I.curr.next);
- if l.tail = l.curr then $l.tail \leftarrow l.curr.next$;
- 3 *l.cnt*++;

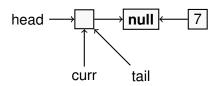

Algorithm: void insert(List I, E it)

- $l.curr.next \leftarrow create_link(it, l.curr.next);$
- **if** l.tail = l.curr **then** $l.tail \leftarrow l.curr.next$:
- 1.cnt++;

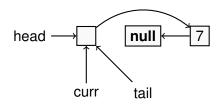

Algorithm: void insert(List I, E it)

- 1 I.curr.next ← create_link(it, I.curr.next);
- if l.tail = l.curr then $l.tail \leftarrow l.curr.next$;
- 3 *l.cnt*++;

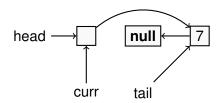

Algorithm: void insert(List I, E it)

- $l.curr.next \leftarrow create_link(it, l.curr.next);$
- **if** l.tail = l.curr **then** $l.tail \leftarrow l.curr.next$:
- 1.cnt++;

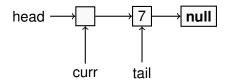

Algorithm: void insert(List I, E it)

- 1 $l.curr.next \leftarrow create_link(it, l.curr.next);$
- if I.tail = I.curr then I.tail \leftarrow I.curr.next;
- 3 *l.cnt*++;

Better presented as follows

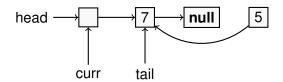

Algorithm: void insert(List I, E it)

- $l.curr.next \leftarrow create_link(it, l.curr.next);$
- **if** l.tail = l.curr **then** $l.tail \leftarrow l.curr.next$:
- 1.cnt++;

insert(1,5)

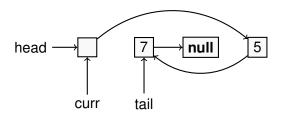

Algorithm: void insert(List I, E it)

- $l.curr.next \leftarrow create_link(it, l.curr.next);$
- **if** l.tail = l.curr **then** $l.tail \leftarrow l.curr.next$:
- 1.cnt++;

insert(1,5)

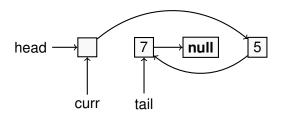

Gustavo Carvalho

Algorithm: void insert(List I, E it)

- $l.curr.next \leftarrow create_link(it, l.curr.next);$
- **if** l.tail = l.curr **then** $l.tail \leftarrow l.curr.next$:
- 1.cnt++;

insert(1,5)

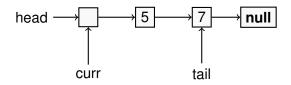

Algorithm: void insert(List I, E it)

- 1 I.curr.next ← create_link(it, I.curr.next);
- if I.tail = I.curr then I.tail \leftarrow I.curr.next;
- 3 *l.cnt*++;

Better presented as follows

List ADT implemented as a linked list

Algorithm: void moveToStart(List I)

I.curr ← I.head:

Algorithm: void prev(List I)

- if *l.curr* = *l.head* then return:
- 2 Link temp \leftarrow 1.head;
- **while** $temp.next \neq l.curr$ **do** $temp \leftarrow temp.next$;
- $l.curr \leftarrow temp;$

Algorithm: void next(List I)

if $l.curr \neq l.tail$ then $l.curr \leftarrow l.curr.next$;

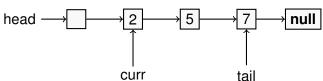

List ADT impl. as a linked list: <2|5,7> → <2|7>

Algorithm: E remove(List I)

- if I.curr.next = NULL then return NULL;
- 2 E it ← I.curr.next.element;
- if l.tail = l.curr.next then $l.tail \leftarrow l.curr$;
- 4 *l.curr.next* ← *l.curr.next.next*; *l.cnt--*;
- 5 **return** *it*;

remove(1), just after insert(1,2); next(1)

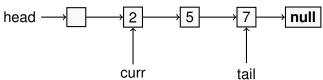

List ADT impl. as a linked list: $\langle 2|5,7 \rangle \leftrightarrow \langle 2|7 \rangle$

Algorithm: E remove(List I)

- **if** *l.curr.next* = *NULL* **then return** *NULL*:
- $E it \leftarrow I.curr.next.element$:
- **if** l.tail = l.curr.next **then** $l.tail \leftarrow l.curr$:
- $l.curr.next \leftarrow l.curr.next.next$; l.cnt--;
- return it:

Gustavo Carvalho

```
remove(1), just after insert(1,2); next(1)
```

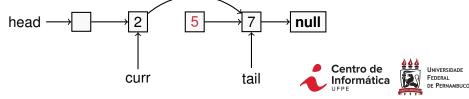

List ADT impl. as a linked list: $\langle 2|5,7 \rangle \rightsquigarrow \langle 2|7 \rangle$

Algorithm: E remove(List I)

- **if** *l.curr.next* = *NULL* **then return** *NULL*:
- $E it \leftarrow l.curr.next.element$:
- **if** l.tail = l.curr.next **then** $l.tail \leftarrow l.curr$:
- *l.curr.next* ← *l.curr.next.next*; *l.cnt--*;
- return it:

remove(1), just after insert(1,2); next(1)

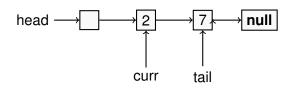

List ADT impl. as a linked list: <2|5,7> → <2|7>

Algorithm: E remove(List I)

- if I.curr.next = NULL then return NULL;
- 2 $E it \leftarrow l.curr.next.element$;
- 3 **if** l.tail = l.curr.next **then** $l.tail \leftarrow l.curr$;
- 4 *l.curr.next* ← *l.curr.next.next*; *l.cnt--*;
- 5 **return** *it*;

After memory deallocation (by the user or by the GC)

Other considerations

List ADT as an array

- ± Predefined maximum size (alternative: dynamic arrays)
 - Dynamic allocation of arrays does not imply dynamic arrays
 - Amortised analysis (append): cost of copy becomes not relevant
- + No extra space with pointers (links)
- Space consumed by unused positions

List ADT as a linked list

- + With no predefined maximum size
- + No extra space for no longer accessible elements
- Space consumed by pointers (links)
