UFPE – CENTRO DE INFORMÁTICA ESTRUTURAS DE DADOS ORIENTADAS A OBJETOS ATIVIDADE PRÁTICA

(Gustavo Carvalho – ghpc@cin.ufpe.br)

Exercícios selecionados de: KIRCH-PRINZ, U., PRINZ, P. A Complete Guide to Programming in C++. 1a Edição. Editora Jones & Bartlett Learning, 2001.

Exercise 1

Write a global function called <code>splice()</code> that "splices" two <code>int</code> arrays together by first allocating memory for a dynamic array with enough room for both <code>int</code> arrays, and then copying the elements from both arrays to the new array, as follows:

- first, the elements of the first array are inserted up to a given position,
- then the second array is inserted,
- then the remainder of the first array is appended.

Arguments: the two int arrays, their length, and the position at which they are to be spliced. Return value: a pointer to the new array.

Exercise 2

Write a function min() that computes and returns the minimum of given positive numbers. The function expects a variable number of unsigned int values as arguments. The last argument must be the number 0.
